Comprehension:

An earthquake is what happens when two blocks of the earth suddenly slip past one another. The surface where they slip is called the fault or fault plane. The location below the earth's surface where the earthquake starts is called the hypocenter, and the location directly above it on the surface of the earth is called the epicenter.

Sometimes an earthquake has foreshocks. These are smaller earthquakes that happen in the same place as the larger earthquake that follows. Scientists can't tell that an earthquake is a foreshock until the larger earthquake happens. The largest, main earthquake is called the mainshock. Mainshocks always have aftershocks that follow. These are smaller earthquakes that occur afterwards in the same place as the mainshock. Depending on the size of the mainshock, aftershocks can continue for weeks, months, and even years after the mainshock!

The earth has four major layers: the inner core, outer core, mantle and crust. The crust and the top of the mantle make up a thin skin on the surface of our planet.

But this skin is not all in one piece – it is made up of many pieces like a puzzle covering the surface of the earth. Not only that, but these puzzle pieces keep slowly moving around, sliding past one another and bumping into each other. We call these puzzle pieces tectonic plates, and the edges of the plates are called the plate boundaries. The plate boundaries are made up of many faults, and most of the earthquakes around the world occur on these faults. Since the edges of the plates are rough, they get stuck while the rest of the plate keeps moving. Finally, when the plate has moved far enough, the edges unstuck on one of the faults and there is an earthquake.

Comprehension:

Read the following passage and answer the question.

In the years leading up to the Russian Revolution of 1917, the country had a succession of wars. These were, The Crimean War, The Russo-Turkish War, The Russo-Japanese War and The World War I. All of these required a lot from the state, including tax dollars and manpower. Russia suffered defeat in all, except against Turkey. This series of war caused great discontent among the people and caused suffering in the country's economy and government.

Along with these wars, there were three major parties that contributed to the cause of the revolution. First, there were the peasants, who maintained the majority of the population in Russia. They were excessively poor and could barely escape famine from harvest to harvest. The population boom in Russia from 1867-1896 was felt most drastically by the peasants. The increase of 30 million people in less than 30 years was too great that the land to the peasants' disposal did not increase sufficiently. The government tried to help, but war took precedence. Second, there was a rise of the industrial working class. These workers were employed in the mines, factories and workshops of the major cities. They suffered low wages, poor housing and many accidents. Again, the government tried to help by passing factory acts to restrict the number of hours one could work. However, their efforts were at too small a scale to have any real effect. As a result, there were many strikes and constant conflicts between the workers and the police. Lastly, the tsar of Russia was the cause of much disapproval. Tsar Nicholas II was much more interested in his family life, than matters of the state. He had an obsession with retaining all his privileges and the belief that he was chosen by God to rule. Also, he didn't understand the forces of industrialization and nationalism that were growing throughout Russia. His disregard for the struggles of the people led them to lose faith in him and the long-standing tradition of autocracy. The people were not content and were ready to revolt. They just needed a good reason and a strong leader.

Comprehension:

Read the given passage and answer the questions that follow.

Key factors influencing subway air pollution will include station depth, date of construction, type of ventilation (natural/air conditioning), types of brakes (electromagnetic or conventional brake pads) and wheels (rubber or steel) used on the trains, train frequency and more recently the presence or absence of platform screen-door systems.

In particular, much subway particulate matter is sourced from moving train parts such as wheels and brake pads, as well as from the steel rails and power-supply materials, making the particles dominantly iron-containing.

To date, there is no clear epidemiological indication of abnormal health effects on underground workers and commuters. New York subway workers have been exposed to such air without significant observed impacts on their health, and no increased risk of lung cancer was found among subway train drivers in the Stockholm subway system.

But a note of caution is struck by the observations of scholars who found that employees working on the platforms of Stockholm underground, where PM concentrations were greatest, tended to have higher levels of risk markers for cardiovascular disease than ticket sellers and train drivers.

The dominantly ferrous particles are mixed with particles from a range of other sources, including rock ballast from the track, biological aerosols such as bacteria and viruses, and air from the outdoors, and driven through the tunnel system on turbulent air currents generated by the trains themselves and ventilation systems.

Another feature of the post-Cold War era is that since the West has become the victor of the East-West ideological rivalry, Western systems and Western influences, in general, started to dominate the whole world. For example, the United States has visibly enhanced its influence in the Middle East and in Caucasus since the end of the Cold War. The invasion of Kuwait by Iraq in August 1990 and the following Gulf Crisis, in a way, created an opportunity for the United States to exercise its hegemonic power in the Middle East. In the following years, in the absence of a counter-power, the influence of the United States increased further. With the military operation to Afghanistan and invasion of Iraq after the September 11, 2001 attacks, the United States perpetuated its dominance in the region. The region of Caucasus was formerly under the Russian sphere of influence. But the United States managed to enter this energy-rich region with some new allies, used to be the part of the Soviet Union, such as Azerbaijan, Ukraine, and Georgia. Although Russia certainly did not want the United States presence in the region, its ability to prevent it has remained limited. Likewise, NATO expanded to involve Eastern Europe, a region also used to be under Soviet influence. Russia, in the beginning, tried to resist NATO expansion, posing several threats, including creating a counter defense organization. But it was eventually convinced with the project of "partnership for peace", through which it preserved many of its privileges in Eastern European countries.

Americans are looking to get out of town after a year of virus-related travel restrictions. Figuring out where they can go and what will be open when they get there remain tricky—for both would-be tourists and travel companies.

Signs that consumers are ready to travel again are growing, with rising searches for airfares and activity on booking sites. Travel companies are providing tools to help make sense of restrictions and spur bookings, but a hazy outlook for international trips suggests domestic destinations will see the strongest demand.

Diana Zucknick and her husband, Paul, visited 14 countries in the five years before Covid-19 caused them to hunker down at their Austin, Texas, home. Now that both are vaccinated, they are anxious to resume traveling.

As they sat down to plan travel, Ms. Zucknick said, they pondered questions they hadn't considered before: Which countries will allow Americans in? Would they face a lengthy quarantine or be putting others at risk? How safe are layovers?

Hong Kong had been high on their list, she said, but the logistics of that trip amid current travel restrictions, including a 21-day quarantine requirement, seemed daunting. "There are so many variables," she said. "Everything is up in the air." Ms. Zucknick, 38 years old, has yet to make a booking. So far they have traveled only in Texas.

Market-research firm AirDNA, which tracks business on Airbnb Inc. and rival home-rental site Vrbo, said bookings made in the U.S. in February reached their highest monthly level since it began tracking the industry in 2015. Those figures included reservations for future stays.

Comprehension:

With the second-largest population in the world, India is home to over 1.3 billion people. At an average of two children born per woman in 2018, the country's birth rate stood at 18.6 for every thousand inhabitants. The average life expectancy has seen a consistent increase since the 1920s and was around 69 years in 2019. However, this was still lower than the global average of around 72 years. That same year, the country's death rate was recorded at about 7.3 deaths for every thousand inhabitants. Infant mortality has also been on a steady decline over the years due to increased attention to providing special newborn care units, routine immunization and access to basic mother and child care facilities. Moreover, female infanticide and gender-selective abortions have seen a relative decline in the country ever since government regulations made such procedures illegal.

Despite these positive indicators, India had the highest number of undernourished people in the Asia Pacific region. And even though undernourishment was largely seen among low income families, it was surprisingly also observed among Indians who were from higher socio-economic classes. Growing fast food consumption, unhealthy diet trends and an inactive lifestyle were some of the main contributing factors for this. Comprehension:

With the second-largest population in the world, India is home to over 1.3 billion people. At an average of two children born per woman in 2018, the country's birth rate stood at 18.6 for every thousand inhabitants. The average life expectancy has seen a consistent increase since the 1920s and was around 69 years in 2019. However, this was still lower than the global average of around 72 years. That same year, the country's death rate was recorded at about 7.3 deaths for every thousand inhabitants. Infant mortality has also been on a steady decline over the years due to increased attention to providing special newborn care units, routine immunization and access to basic mother and child care facilities. Moreover, female infanticide and gender-selective abortions have seen a relative decline in the country ever since government regulations made such procedures illegal.

Despite these positive indicators, India had the highest number of undernourished people in the Asia Pacific region. And even though undernourishment was largely seen among low income families, it was surprisingly also observed among Indians who were from higher socio-economic classes. Comprehension:

An endangered species is a type of organism that is threatened by extinction. Species become endangered for two main reasons: loss of habitat and loss of genetic variation. A loss of habitat can happen naturally. Dinosaurs, for instance, lost their habitat about 65 million years ago. The hot, dry climate of the Cretaceous period changed very quickly, most likely because of an asteroid striking the Earth. The impact of the asteroid forced debris into the atmosphere, reducing the amount of heat and light that reached Earth's surface. The dinosaurs were unable to adapt to this new, cooler habitat. Dinosaurs became endangered, then extinct. Human activity can also contribute to a loss of habitat. Development for housing, industry, and agriculture reduces the habitat of native organisms. This can happen in a number of different ways.

Development can eliminate habitat and native species directly. In the Amazon rain forest of South America, developers have cleared hundreds of thousands of acres. To "clear" a piece of land is to remove all trees and vegetation from it. The Amazon rain forest is cleared for cattle ranches, logging, and urban use. Development can also endanger species indirectly. Some species, such as fig trees of the rain forest, may provide habitat for other species. As trees are destroyed, species that depend on that tree habitat may also become endangered. Tree crowns provide habitat in the canopy, or top layer, of a rainforest. Plants such as vines, fungi such as mushrooms, and insects such as butterflies live in the rain forest canopy. So do hundreds of species of tropical birds and mammals such as monkeys. As trees are cut down, this habitat is lost. Species have less room to live and reproduce.

Comprehension:

India is a diverse nation with many different cultures. Although there are some eating habits that are considered staples of Indian cuisine, these habits may not be practiced by all the cultures of India. Cuisine differs across India's diverse regions as a result of variation in local culture, geographical location (proximity to sea, desert, or mountains), and economics. It also varies seasonally, depending on which fruits and vegetables are ripe. Also, Middle Eastern and Central Asian influences have occurred on North Indian cuisine from the years of Mughal rule. Indian cuisine is still evolving, as a result of the nation's cultural interactions with other societies.

Historical incidents such as foreign invasions, trade relations, and colonialism have played a role in introducing certain foods to the country. For instance, potato, a staple of the diet in some regions of India, was brought to India by the Portuguese, who also introduced chilies and breadfruit. Indian cuisine has shaped the history of international relations; the spice trade between India and Europe was the primary catalyst for Europe's Age of Discovery. Spices were bought from India and traded around Europe and Asia. Indian cuisine has influenced other cuisines across the world, especially those from Europe, the Middle East, North Africa, sub-Saharan Africa, Southeast Asia, the British Isles, Fiji, and the Caribbean.

Indian food is rich in flavor. However, spices do more than flavor a dish; They are also used to cool and warm the body during hot or cold weather. Yogurt is commonly used to flavor dishes or as a sauce to chill spicy dishes. Many Indian dishes are cooked in vegetable oil, but peanut oil is popular in northern and western India, mustard oil in eastern India, and coconut oil along the western coast, especially in Kerala. Gingelly (sesame) oil is common in the south since it imparts a fragrant, nutty aroma. In recent decades, sunflower, safflower, cottonseed, and soybean oils have become popular across India. Butter-based ghee, or deshi ghee, is used frequently, though less than in the past.
