Comprehension:

Read the passage and answer the questions that follow.

Markus Klementz is preparing to take his first step in seven years. Concentrating intensely, he watches his brainwaves rise and fall on a computer screen with every clench of his jaw. His last steps were at a ski resort in Chile, where an accident shattered three of his vertebrae and left him unable to move his legs. He recalls being rescued and taken by helicopter to a hospital, and woke up two days later.

Now, the 39-year-old Swiss pharmacist stands in a harness between two handrails at NeuroRestore, a spinal-injury research centre in Lausanne run by Professor Grégoire Courtine. Klementz has undergone pioneering surgery involving a brain-implanted sensor, a spinal electrode patch and a receiver that connects the two. A team of researchers prepares him for his first attempt to stand and move again using this breakthrough technology. Spinal injuries have long been considered untreatable. The earliest known medical record of such an injury, an Egyptian papyrus from around 1600 BC, describes paralysis as “an ailment not to be treated”. Despite advances in medicine, paralysis still affects around 15 million people worldwide, often caused by sudden accidents that sever communication between the brain and the body.
